Q: Get the PID of a running Java process from a Java program How do you get the PID of the Java process from within the Java program? A: Running Java application: To obtain the Process object: Process p = Runtime.getRuntime().exec("command").getProcess(); To obtain the Process object from a java program: Process p = Runtime.getRuntime().exec(new String[]{"java", "-jar", "app"}).getProcess(); Spawning a new Java application: To obtain the Process object: Process p = Runtime.getRuntime().exec("command").getProcess(); A: Basically the ptrace(2) Linux system call is the way to go. See here for an example. The basic idea is that you read/write to the special file associated with the ptrace process at the pid given in the second argument (the path given to the program). Another option would be to use the JNI method Java\_java\_lang\_Process\_getProcess to get the process from the object representing the Java VM. You would call this method from a method implemented in a class that represents the "your application" (e.g. execute with the reflection API to get a handle to the relevant class, and then call the method). For instance: jclass cls = env.FindClass("com/some/package/MyApplication"); jmethodID getProcess = env.GetMethodID(cls, "getProcess", "()Ljava/lang/Process;"); Proc proc = (Proc) env.CallObjectMethod(cls, getProcess); Of course, this would require you to distribute a suitable JAR with your application, so as to have access to the classes it uses (or at least the ones you want to use...). Leptin administration ameliorates streptozotocin-induced type 2 diabetic nephropathy: mechanisms underlying protection. We evaluated the effects of recombinant leptin (rLeptin) administration on renal damage in streptozotocin (STZ)-induced type 2 diabetic rats. Five weeks after STZ treatment, the rats were injected intraperitoneally with rLeptin
