To download or Q: Clarification of the definition of convolution I have been trying to understand the definition of convolution. I understand it as this: Given two functions f and g : $f(t) = \int_{-\infty}^{\infty} f_0(t-x)g(x) dx$ Where f_0 and g are arbitrary functions and x is a dummy variable. However, the definition that I am reading is this: $f(t) = \int_{-\infty}^{\infty} f_0(x)g(t-x) dx$ I am confused. I don't see why the variable t should be moved inside the function f_0 . Why can't we just do it this way? $f(t) = \int_{-\infty}^{\infty} f_0(x)g(t-x) dx$ I am quite confident that this can be done, but I just don't see how. Any clarification would be greatly appreciated. A: If x and t are real numbers, the convolution theorem is a theorem about Fourier transforms. The Fourier transform of $g(t-x)$ is $\hat{g}(\omega)e^{-i\omega x}$, where \hat{g} is the Fourier transform of g , and $e^{-i\omega x}$ is a phase factor. So if you have a continuous function f , then its Fourier transform $\hat{f}(\omega)$ will be the Fourier transform
