To study the anti-arrhythmic efficacy of the selective cyclooxygenase-2 (COX-2) inhibitor meloxicam. Experiments were carried out in 12 canine in-vivo models of chronic ventricular arrhythmias. In all studies, meloxicam was given as a single oral dose (5 mg/kg). In the first four models, there were not sufficient data to permit determination of the anti-arrhythmic efficacy of meloxicam. In the last eight models, the anti-arrhythmic efficacy of meloxicam was tested in a randomized, double-blinded, placebo-controlled manner. In models 1 and 2, where the arrhythmias were induced by coronary artery occlusion and the repeated administration of adrenaline, meloxicam had no anti-arrhythmic effect. In models 3 and 4, where the arrhythmias were induced by anterograde and retrograde electrical pacing and the repeated administration of adrenaline, meloxicam also had no anti-arrhythmic effect. In the six remaining models of chronic ventricular arrhythmias, there was anti-arrhythmic efficacy of meloxicam, which was comparable to that of quinidine. In all of the six models, the anti-arrhythmic efficacy of meloxicam was clearly time-dependent, with maximal anti-arrhythmic efficacy after 1 to 5 days of treatment with the drug. The selective COX-2 inhibitor meloxicam has anti-arrhythmic efficacy in some models of chronic ventricular arrhythmias in the dog. Whether this anti-arrh
