Since the 1970s, CAD (computer-aided design) software has been marketed to professional architects, engineers, interior designers, and others involved in design and drafting. Before the 1980s, CAD was primarily used by commercial aircraft designers. The first CAD software was developed for use on mainframe computers, which are more expensive than their smaller desktop counterparts. Mainframe computers are often used by design firms to design commercial buildings or larger aircraft, ships, and submarines. Architects and engineers use CAD software in a variety of ways, including for 2D and 3D drafting, paper and other plotter-based design, and for producing presentation materials. CAD Applications Software Developers Many software developers have made their own CAD or drafting software, with an important group of smaller companies producing 2D and 3D CAD applications that run on inexpensive desktops or laptops. The majority of these developers began in the 1970s with programs written for home use that grew into large, feature-rich applications for use in the design industry. Software companies have been writing CAD software for well over three decades. Some of the earliest CAD programs were for the purpose of generating drawing manuals for mainframe computers, and of producing presentations and illustrations for architectural and engineering firms. Today, most CAD programs are designed for use by architects, engineers, interior designers, and others involved in the design and drafting of products such as aircraft, vehicles, and consumer goods. Although AutoCAD is a commercial desktop CAD program for architecture and engineering, most developers of drawing software for the design industry are not interested in the financial side of software development and other companies have purchased AutoCAD or other programs from Autodesk. Thus, many design software programs have been purchased to generate 2D and 3D models for large engineering firms, interior designers, and other design professionals. This distinction is important to keep in mind as we go through the AutoCAD product family. Designer The most basic use of a CAD program is for a designer to create and edit 2D and 3D models. CAD drawings are used in the design and development of products ranging from household items to space vehicles, and all levels of CAD software are in common use in the design industry. CAD Drawings The most common type of CAD drawings are 2D, or line drawings. A 2D drawing consists of lines, or “strokes,” drawn on a sheet of paper. Sometimes, the strokes are dashed lines

The operating system can have a hard-coded view of the drawing database, however an external program such as a database or CAD viewer can be used for this purpose. If desired, the AutoCAD drawing database can be presented using the native Windows operating system as a computer-aided design database, or an ASCII-based design database can be used, that is a simple text format that is both easy to work with and relatively inexpensive to use. In AutoCAD and AutoCAD LT, the drawing database is a database that is part of the actual AutoCAD (or AutoCAD LT) software and is not a file in a file system. AutoCAD/AutoCAD LT treats the drawing database as the application itself and not as a standalone entity. The drawing database (previously referred to as the drawing file) is both a model of the drawing and the information used to display the drawing on screen. It can contain information about the drawing itself as well as metadata. This metadata can contain the name of the drawing, the person creating it, the date it was created, the version of AutoCAD it was created in and its creation environment. The drawing database is organized into a tree structure. Any drawing is created in a folder. Each drawing is a leaf in the tree and all the drawings in the drawing database are the branches of the tree. AutoCAD (previously known as AutoCAD DWG) uses internal tables to store the information about the drawings. In comparison, AutoCAD LT uses external files to store the metadata. For example, a drawing database will typically contain a folder called: If the drawings have not been exported, then the folder will contain drawings themselves. For example: There are two types of metadata within the database: "Information About the Drawings" (which is text) and "Information About the Files" (which is binary). In AutoCAD, the drawing database is a complex and extensive set of tables. When a drawing is imported into a new project, the drawings in the current project must be deleted from the drawing database before the new drawings can be loaded into it. AutoCAD and AutoCAD LT support all kinds of files in the drawing database. These include other drawings, both DWG and DXF drawings, or even plain text or engineering files in some cases. An export to a plain text file allows for easy use of the drawing in a non-AutoCAD environment. 5b5f913d15
